# <u>Cardiff and Vale Traumatic Stress Service</u> <u>PTSD Prescribing Algorithm – V2 – 30 May 2019</u>

### Introduction

PTSD is a mental disorder that may develop after exposure to a particularly distressing and catastrophic event with a lifetime prevalence between 1.9% - 8.8%. (1) The disorder is characterised by symptoms of re-experiencing, hyperarousal, avoidance, and altered mood and cognition.

Currently the recommended first line treatment for PTSD is trauma based psychological therapy, with pharmacological treatment only being considered as a second line option. (2)

The recently released ISTSS PTSD Prevention and Treatment Guidelines (3), which are based on the most up to date empirical evidence, gave recommendations for Sertraline, Paroxetine, Fluoxetine, Venlafaxine and Quetiapine as pharmacological treatments of PTSD. (3) NICE (2018) have also updated their guidelines on PTSD, recommending SSRI's or Venlafaxine as pharmacological treatment of PTSD. (2) This contrasts with the previous NICE (2005) guidelines which recommended the use of Mirtazapine, Amitriptyline, Phenelzine and Paroxetine.

Sub-optimal PTSD prescribing practice has been a continuing problem in clinical practice. Some evidence for this came from a research project by a Cardiff Medical student (Amy Baker) in 2018 which looked to assess the use of medication in the treatment of PTSD in the Cardiff and Vale Traumatic Stress Service by auditing it against the NICE guidelines and other evidence-based treatment. The results found that only 64% of patients were on NICE or evidence based recommended pharmacological treatment and the average dose taken of each recommended medication was 42.82% of the recommended maximum dose for each drug. (4)

There may be a number of reasons for sub-optimal prescribing but it is likely that more people with PTSD would benefit from medication if it were prescribed according to the current evidence base. To facilitate this, in the absence of an existing prescribing tool for PTSD, an algorithm for PTSD prescribing has been developed to help clinicians make appropriate decisions about the pharmacological treatment for people with PTSD.

# **PTSD Pharmacological Prescribing Algorithm**

#### Discuss drug choice with person with PTSD

#### Include:

- Potential adverse effects (side effects, discontinuation symptoms).
- Potential interactions with concomitant medication or physical illness.
- Individual's perception of the efficacy and tolerability of any SSRI's/SNRI's in the past.

If individual has no contraindicated medical reasons and gives consent, a SSRI should be initiated.

### 1st Line

Start SSRI

#### **Fluoxetine**

- Initiate on 20mg/day.
- Dosage can be increased by 20mg/day increments at monthly appointments with clinician to a maximum of 60mg/day based on clinical response and tolerability.

#### **Paroxetine**

- Initiate on 20mg/day.
- Dosage can be increased by 20mg/day increments at monthly appointments with clinician to a maximum of 60mg/day based on clinical response and tolerability.

#### Sertraline

- Initiate on 50mg/day.
- Dosage can be increased by 50mg/day increments at monthly appointments with clinician to a maximum of 200mg/day based on clinical response and tolerability.

# 2<sup>nd</sup> Line

If SSRI is not tolerated or still showing clinically significant symptoms.

### Change SSRI or start on Venlafaxine

### Venlafaxine

- Initiate on 75mg/day.
- Dosage can be increased by 75mg/day increments at monthly appointments with clinician to a maximum of 300mg/day based on clinical response and tolerability.

If still showing clinically significant symptoms and Venlafaxine better tolerated.

If both SSRI and Venlafaxine are not tolerated at

If still showing clinically significant symptoms and SSRI better tolerated.

### **Adjunctive Therapy**

### Venlafaxine

Quetiapine/Prazosin (Adjuncts)

(see algorithm notes for Prazosin dosing)

3<sup>nd</sup> Line

SSRI

**Adjunctive Therapy** 

Quetiapine/Prazosin (Adjuncts) (see algorithm notes for Prazosin dosing)

If still showing clinically significant symptoms.

### Quetiapine

- Initiate 25mg/day at night. After 1 week 25mg bd.
- -Dosage can be increased by 50mg/day increments at monthly appointments with clinician to a maximum of 400mg/day\* based on clinical response and tolerability.

If still showing clinically

significant symptoms.

If still showing clinically significant symptoms.

### 4<sup>th</sup> Line

Consider changing to alternative less evidence-based treatment

DOCUMEN C&VTSS P

**Amitriptyline** Mirtazapine **Phenelzine** 

2

# **Algorithm Notes**

- 1) If a person with PTSD is already on psychotropic medication, this should be reduced and stopped as per BNF guidance before starting an alternative.
- 2) From the start of treatment consider **adjunction** of SSRI with:
- **Quetiapine** If marked agitation present in patient.
- **Trazadone 50mg-100mg night/ Mirtazapine 15mg night** If insomnia present in patient.
- 3) Side effect profile is similar for all SSRI's, however notable considerations to make when choosing SSRI:
- **Sertraline**: Fewer side effects.
- **Fluoxetine:** More Alerting potentially less suited if person with PTSD is agitated at start.
- **Paroxetine:** Greater risk of discontinuation symptoms.
- 4) SSRI's/SNRI's have many drug interactions even with common drugs used to manage rudimentary illnesses. Therefore, it is important to be fully aware of what concomitant medications the patient is on before initiating treatment.
  - Here is a brief outline of some common drug interactions with SSRI's/SNRI's and their potential consequences if co-prescribed: (5)
- Other serotonergic drugs = Increased risk of Serotonin Syndrome.
- Drugs that affect haemostasis (e.g. Aspirin and NSAID's) = Increased risk of bleeding (especially Upper GI)
- Drugs inducing hyponatraemia (e.g. Diuretics) = Increased risk of developing hyponatraemia.
- Other drugs metabolised by CYP2D6.

For a full and detailed outline of the drug interactions for SSRI's/SNRI's and for the other drugs named in the algorithm please visit <a href="https://bnf.nice.org.uk">https://bnf.nice.org.uk</a>.

5) Initiating **Prazosin**:

As there is a risk of severe first-does hypotension, the first and second doses should be taken whilst sitting on a bed just before lying down. It is important to keep well hydrated while taking prazosin and to get up slowly – initially sitting up on the bed and then slowly standing up. For the first two nights it is important to sit on the toilet to pass water rather than stand up.

| Time     | Morning | On going to bed |
|----------|---------|-----------------|
| Days 1-2 | Nil     | 1mg             |
| Days 3-7 | Nil     | 2mg             |
| Week 2   | 1mg     | 4mg             |
| Week 3   | 2mg     | 6mg             |
| Week 4   | 2mg     | 10mg            |

- 6) **Risperidone** also has evidence to be used instead of Prazosin or Quetiapine in adjunctive therapy.
- 7) **Quetiapine** has been used at a maximum dosage of **800mg/day** in PTSD research studies. However, the mean dose of Quetiapine used in PTSD patients in the research studies was **258mg/day**, therefore a lower maximum dose has been recommended in this algorithm although some individuals may benefit from higher doses. It may, therefore be appropriate to use higher doses in some instances; the decision should be made based on the clinician's judgement.

# **Common Adverse Effects (5)**

| Drug          | Sedation | Postural<br>Hypotension | Cardiac<br>Conduction<br>Disturbance | Anticholinergic effects | Nausea/Vomiting | Sexual<br>Dysfunction |
|---------------|----------|-------------------------|--------------------------------------|-------------------------|-----------------|-----------------------|
| Sertraline    | -        | -                       | -                                    | -                       | ++              | +++                   |
| Paroxetine    | +        | -                       | -                                    | +                       | ++              | +++                   |
| Fluoxetine    | -        | -                       | -                                    | -                       | ++              | +++                   |
| Venlafaxine   | -        | _*                      | +                                    | -                       | +++             | +++                   |
| Amitriptyline | +++      | +++                     | +++                                  | +++                     | +               | +++                   |
| Mirtazapine   | +++      | +                       | -                                    | +                       | +               | -                     |
| Phenelzine    | +        | +                       | +                                    | +                       | +               | +                     |

| Drug        | Sedation | Weight gain | Akathisia | Parkinsonism | Anticholinergic effects | Hypotension | Prolactin elevation |
|-------------|----------|-------------|-----------|--------------|-------------------------|-------------|---------------------|
| Quetiapine  | ++       | ++          | -         | -            | +                       | ++          | -                   |
| Risperidone | +        | ++          | +         | +            | +                       | ++          | +++                 |

For full side effect profile for these drugs and more information see <a href="https://bnf.nice.org.uk">https://bnf.nice.org.uk</a>

- = Very low/none

+ = Low

++ = Moderate

+++ = High incidence/severity

\* = Hypertension reported

# **Monitoring requirements**

| All SSRI's and<br>SNRI's | If suicidal ideation prior to commencing treatment monitor on a weekly basis initially                                       |
|--------------------------|--|
| Venlafaxine              | Blood pressure monitoring at <b>initiation</b> , after every <b>change of dose</b> and then at <b>yearly</b> intervals.      |
| Quetiapine               | ECG before starting medication for all patients  |
| All antipsychotics       | Blood tests for: Urea and Electrolytes Full Blood Count Lipids (fasting if possible) Glucose (fasting if possible) Prolactin |
